Pre-Health Students

– A degree in Nutrition and Food Science with a concentration in Nutrition Science will provide a unique set of skills that will improve competitiveness for professional health programs. Not only does this concentration provide the science curriculum required by professional health programs but it also provides students with clinical and counseling experiential learning opportunities. These opportunities are important for entry into professional schools. In addition, students with a BS degree in Nutrition and Food Science are ready for employment in several fields including the pharmaceutical industry, government agencies involved in quality control, and the food industry. Students are also highly competitive for graduate school in multiple disciplines.

The Department of Food Science and Human Nutrition has a *Minor in Nutrition* that provides non-majors, particularly in the life sciences, to gain exposure to the food, nutrition and health fields. The program includes seven courses for a total of 22 credits:

- Principles of Biochemistry
- Principles of Human Physiology
- Human Nutrition
- Nutrition Assessment
- Community Nutrition
- Nutrition in the Life Cycle
- Integrative Nutrition and Metabolism
